Part I

Sequences and Series

1 Sequences

Exercise 1.

Prove:

$$\lim_{n \to \infty} \frac{2n^2 + n + 1}{n^2 + 3} = 2$$

Solution 1.

Let

$$\varepsilon > 0$$

$$\left| \frac{2n^2 + n + 1}{n^2 + 3} \right| - 2 = \left| \frac{2n^2 + n + 1 - 2n^2 - 6}{n^2 + 3} \right|$$

$$= \left| \frac{n - 5}{n^2 + 3} \right|$$

$$\leq \left| \frac{n - 5}{n^2} \right|$$

$$\leq \frac{1}{n}$$

$$\leq \varepsilon$$

Therefore, let $N = \left[\frac{1}{\varepsilon}\right] + 1$. Hence, for this N, $|a_n - L| < \varepsilon$.

Therefore, $\lim_{n \to \infty} \frac{2n^2 + n + 1}{n^2 + 3} = 2$.

Exercise 2.

Prove

$$\lim_{n \to \infty} \frac{n^3 + \sin n + n}{2n^4} = 0$$

Solution 2.

Let $\varepsilon > 0$

$$\left| \frac{n^3 + \sin n + n}{2n^4} \right| \le \left| \frac{n^3 + 1 + n}{2n^4} \right|$$
$$\le \left| \frac{3n^3}{2n^4} \right| = \frac{3}{2} \cdot \frac{1}{n} < \varepsilon$$

Therefore, let $N = \left[\frac{3}{2\varepsilon}\right] + 1$. Hence, for this N, $|a_n - L| < \varepsilon$.

Therefore,
$$\lim_{n \to \infty} \frac{n^3 + \sin n + n}{2n^4} = 0$$

Exercise 3.

Calculate $\sqrt[3]{n^3 + 3n} - n$.

Solution 3.

$$a^{n} - b^{n} = (a - b) \cdot (a^{n-1} + a^{n-2}b + \dots + ab^{n-2} + b^{n-1})$$

Therefore, let

$$a = \sqrt[3]{n^3 + 3n}$$
$$b = \sqrt[3]{n^3}$$

$$a - b = \frac{a^3 - b^3}{a^2 + ab + b^2}$$

$$\therefore \sqrt[3]{n^3 + 3n} - n = \frac{n^3 + 3n - n^3}{(n^3 + 3n)^{2/3} + (n^3 + 3n)^{1/3}n + n^2}$$

$$= \frac{3}{\left(\frac{n^3 + 3n}{n^{3/2}}\right)^{2/3} + \left(\frac{n^3 + 3n}{n^3}\right)^{1/3n} + n}$$

Therefore, the limit is 0.

Exercise 4.

Prove

$$\lim_{n\to\infty}\frac{n!}{n^n}=0$$

Solution 4.

$$0 \le \frac{n!}{n^n} = \frac{1}{n} \frac{2}{n} \dots \frac{n}{n} \le \frac{1}{n}$$

Therefore, by the Sandwich Theorem, $\lim_{n\to\infty} \frac{n!}{n^n} = 0$.

Exercise 5.

Let $a_1 = 3$, $a_{n+1} = 1 + \sqrt{6 + a_n}$. Prove that a_n converges and find its limit.

Solution 5.

If possible, let $\lim_{n\to\infty} a_n = l$.

$$a_{n+1} = 1 + \sqrt{6 + a_n}$$

Taking the limit on both sides,

$$l = 1 + \sqrt{6 + l}$$

$$\therefore l - 1 = \sqrt{6 + l}$$

$$\therefore l = \frac{3 \pm \sqrt{29}}{2}$$

As
$$a_n \ge 0$$
, $l = \frac{3 + \sqrt{29}}{2}$.

$$a_2 = 1 + \sqrt{6 + a_1}$$

$$= 1 + \sqrt{6 + 3}$$

$$= 4$$

$$\therefore a_2 > a_1$$

If possible, let $a_n \ge a_{n-1}$. Therefore,

$$a_{n+1} = 1 + \sqrt{6 + a_n}$$

 $\ge 1 + \sqrt{6 + a_{n+1}} = a_n$

Therefore by induction, $\{a_n\}$ is monotonically increasing.

$$a_1 = 3$$

$$\therefore a_1 \le 5$$

If possible, let $a_n \leq 5$. Therefore,

$$a_{n+1} = 1 + \sqrt{6 + a_n} \le q + \sqrt{11} \le 5$$

Therefore by induction, $\{a_n\}$ is bounded from above by 5. +972 58-628-3629
